

PortStore5: Serial port data logger with LAN connection

RS-232 serial port is still an important interface not only for industrial products. Port can be still found as an output for printers or connected scales, RFID / barcode readers, POS (Point Of Sale), security systems and others. More than 10 years HW group produces converters for connecting RS-232 into LAN network (Ethernet).

Barcode scanner can be connected to a LAN network using PortStore5. Serial port connects via virtual serial port as virtual "COM 17" to any computer with MS Windows. Basic feature of PortStore5 compare to other HW group IP serial products is the internal 4Mb memory for incoming data back up in case of connection or power outage.

A typical application is then replacing a tractor paper printer or a thermo printer. Security systems or monitoring devices output for printers can be then easily archived in a central computer.

The new product PortStore5 follows up the previous models PortStore2 and PortStore4. New features are internal memory, WEB interface and primarily support of full RS-232 port.

About HW group

HW group s.r.o. is a Czech manufacturer of network components. Since 2003 we create products in "IP serial" field for connecting remote RS-232 and RS-485 ports.
